1.1 This document outlines fundamental approaches for assessing the bias of measurement methods and laboratory bias when applying them; it provides a practical framework for routine use in estimating bias and offers guidance to personnel involved in designing, performing, or analyzing measurements. 1.2 It exclusively focuses on measurement methods that produce continuous scale results with single values as outcomes, although these single values may be derived from sets of observations. 1.3 This document applies when the measurement method has been standardized, and all measurements follow that standard. This document provides a comprehensive overview of the test item, encompassing all possible variations and discrepancies. It does not cover specific mathematical formulas or calculations, as these are explained in separate sections.
